A test file

This is how a minimal (non) working example looks like. The more minimal it is, the more likely you will get an answer. Remove everything from your examples which isn't necessary to show the problem:

- the page layout
- the font settings
- the title page
- settings than don't matter

Just a simple:

```
\starttext
    a dozen lines at most
\stoptext
```

Like this:

```
\starttext
    an example
\stoptext
```

and look at it a few times to see what can be left out. If you have a complex workflow, and more files are needed, make a zip and put it somewhere to download; don't spam the list with files (reports and explanations are fine).

An explanation

Because TEX is also about look and feel it can be that your expectations don't match what ConTEXt generates. In that case explain what you needed and what you expect. Maybe make a drawing or fake output. There is no need to come up witt some interface, if needed we will see how and where a possible feature (option) fits in best.

When you have specific wishes or are in a hurry, also be prepared to test as soon as a patch or update is provided. Don't expect us to stay tuned to your problem for too long.

No slop

We see no problem in users asking some large language model driven tool. But don't spam us with its outcome. We start from a problem not a proposed solution. Of course fixing a simple typo or wrong variable is no problem but the internals of ConTEXt let alone the engine mix badly with the kind of reasoning or lack of understanding per 2026.

Also, make clear that if you have a suggestion that it comes from such an agent. If you don't really understand what is going on, just say so and don't rely on an language model to make you wiser with hundred percent accuracy.

Hans (also for Wolfgang, Mikael, . . .)
